JAFORD · Technical profile

Functional materials development

Functional materials development

Develop MOFs, COFs, advanced membrane materials, functional polymers and porous materials with specialist synthesis, processing and characterization resources. We assess the route and application together to move from small samples toward larger batches and material validation.

Catalog information

Type	Functional materials development
Application / scope	Develop MOFs, COFs, advanced membrane materials, functional polymers and porous materials with specialist synthesis, processing and characterization resources. We assess the route and application together to move from small samples toward larger batches and material validation.

Development / testing scope

Route assessment and synthesis coordination for metal–organic frameworks (MOFs) and covalent organic frameworks (COFs).

Functional polymers, resins, ligands and related intermediates; process reproduction or optimization when agreed.

Coordination of purification, agreed characterization and project-specific material preparation.

Catalog facts: owner-supplied JAFORD product and capability brief. A technical profile is not a batch certificate, safety data sheet or measured performance report.
